

Tired of Toddle being unreliable and annoying to use?

Well...

Introducing the solution!

The key issue and users

- 60% of students globally face stress due to improper studying planning
- Students who dislike Toddle (Basically everyone including teachers)

Why StudySmart?

- Helps manage time better while studying
- Free to use
- Connects to Toddle
- Sends you reminder emails
- Reduced Stress

3 GOOD HEALTH
AND WELL-BEING

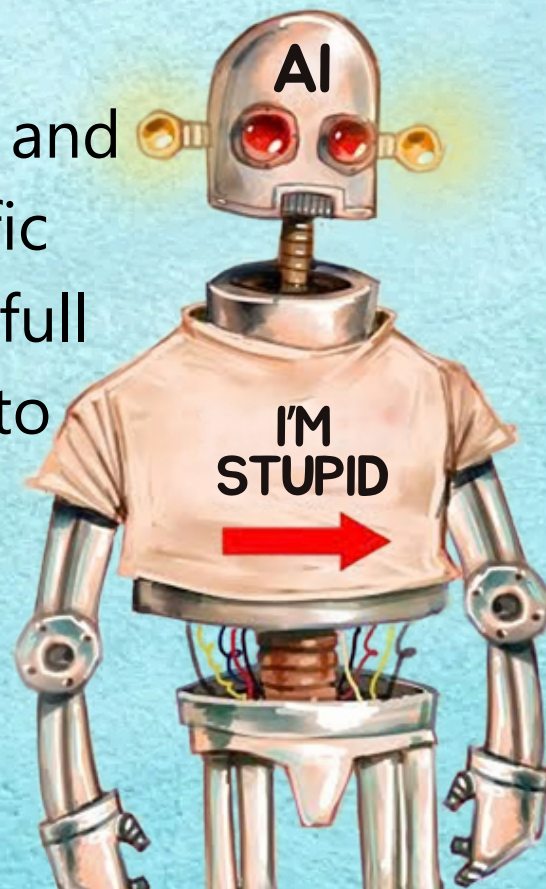

Features

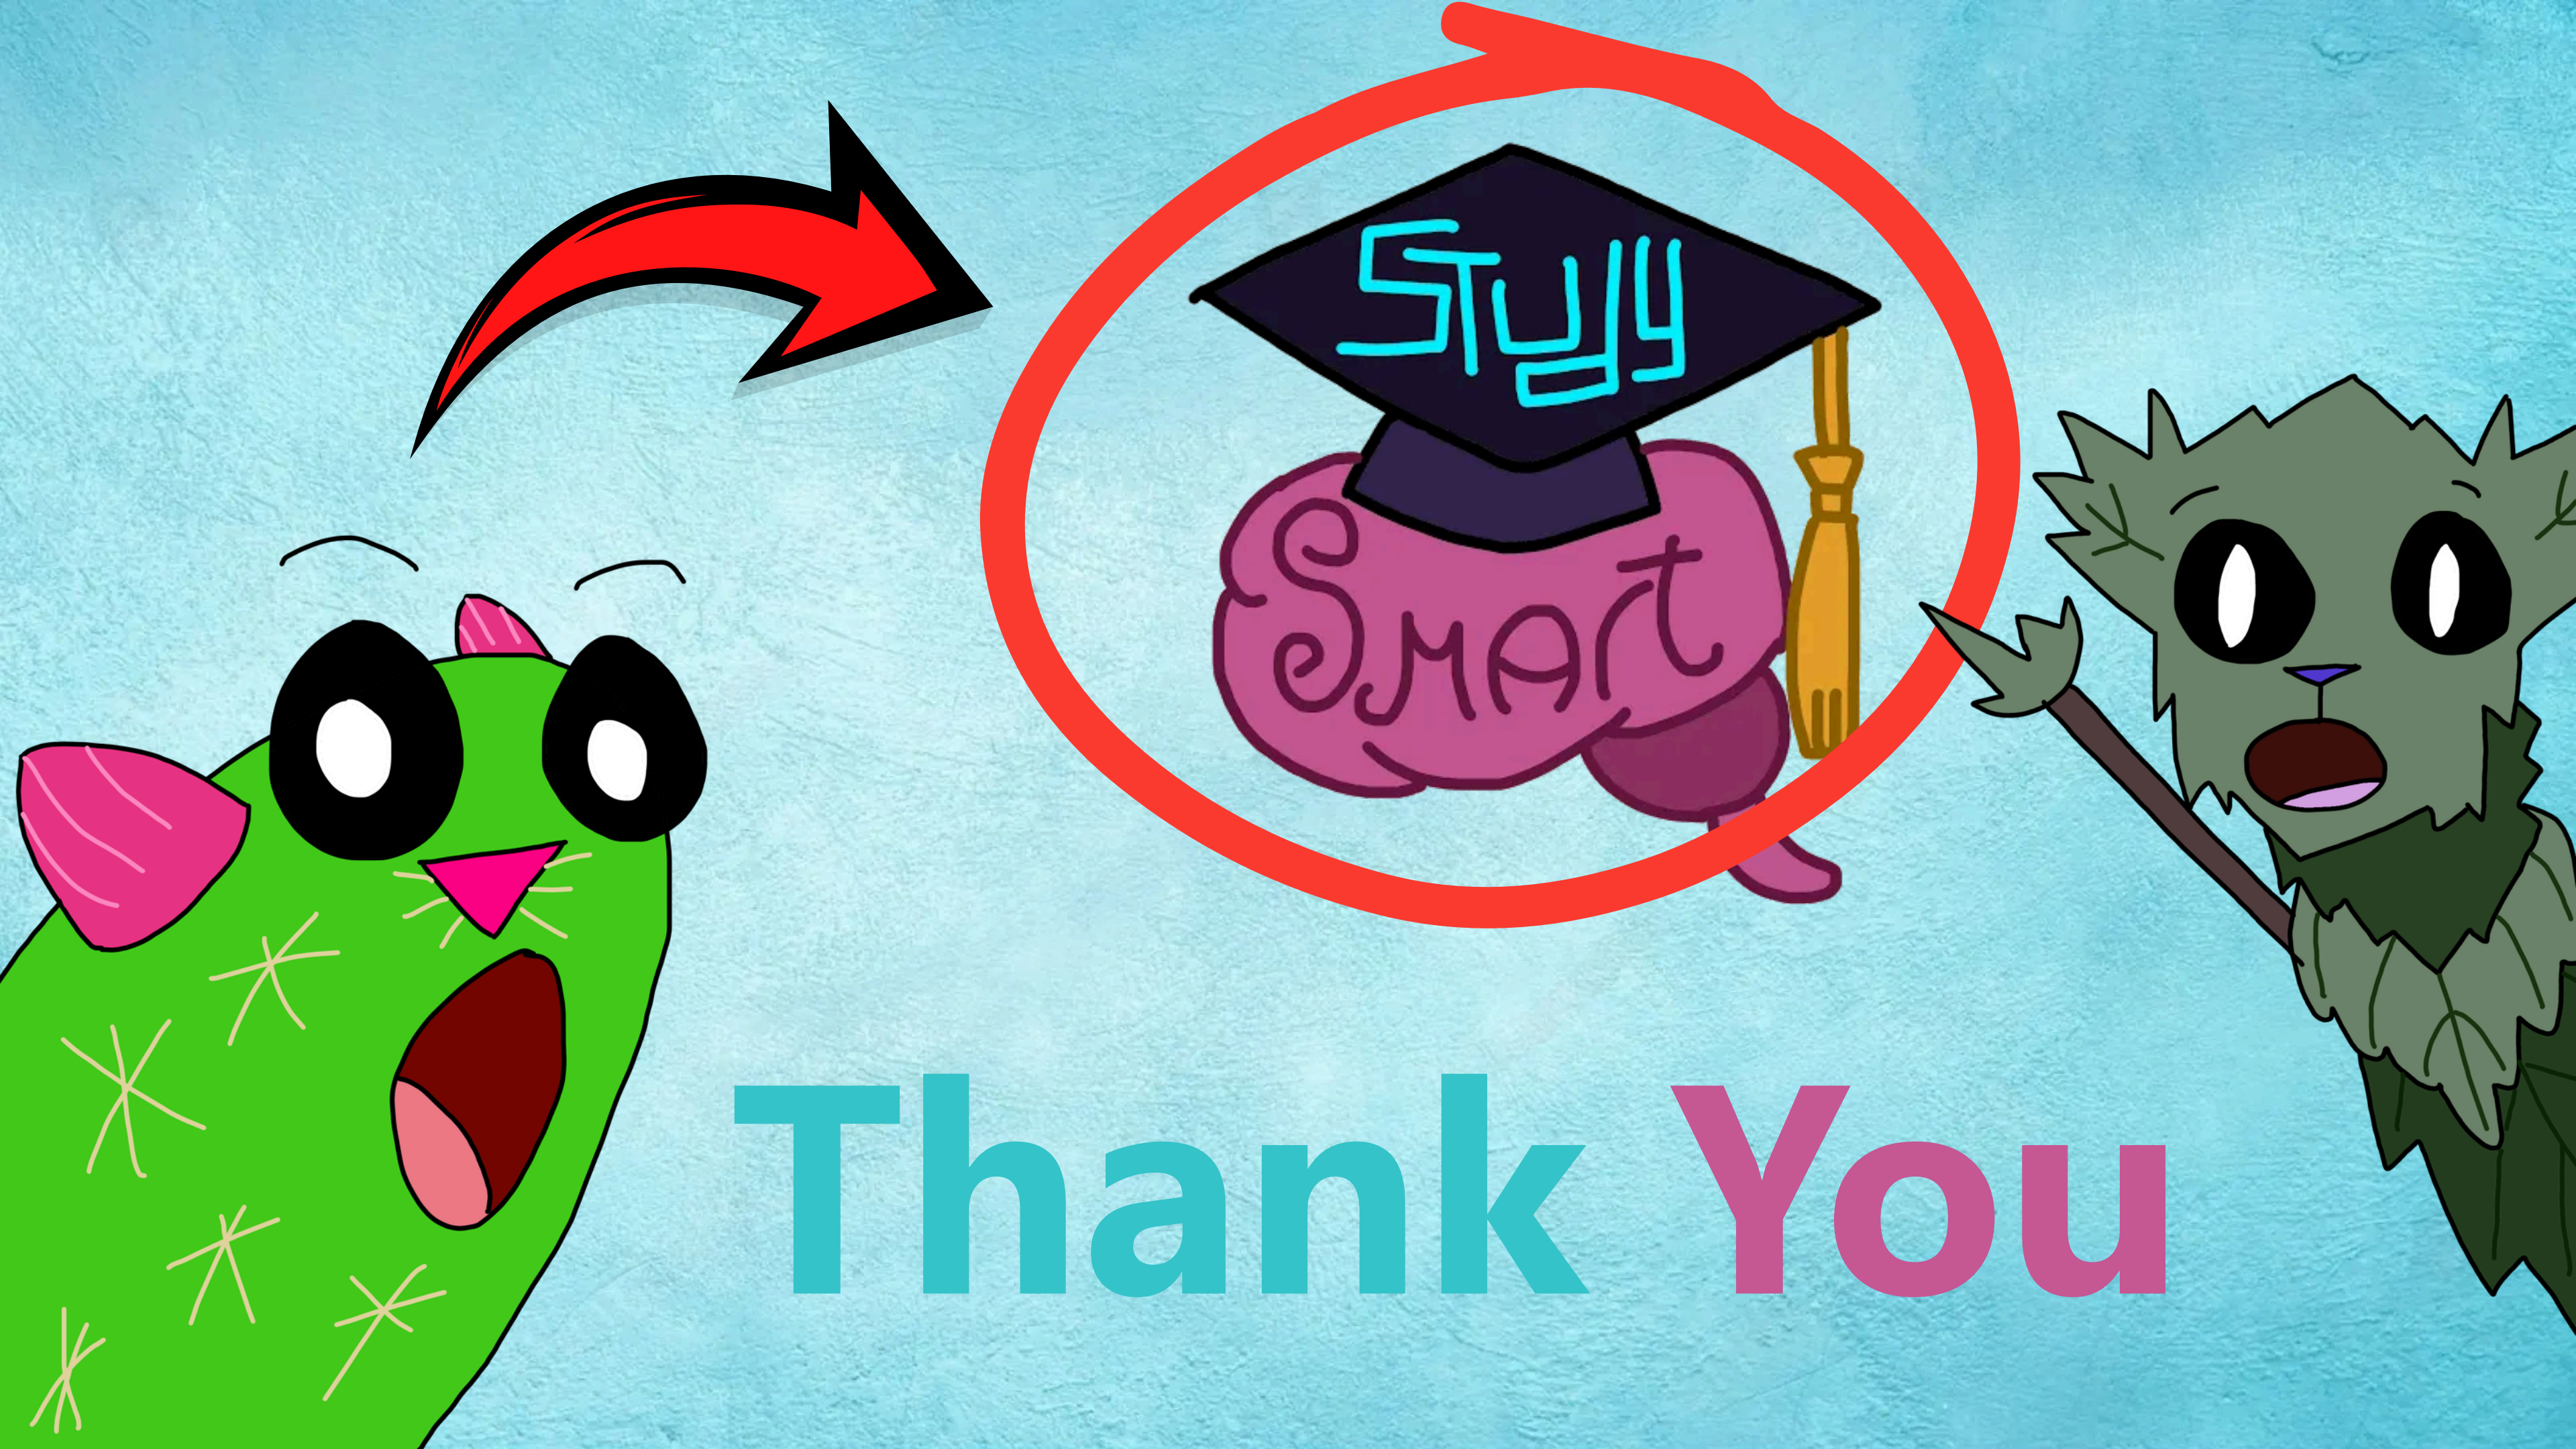

- Store preferences for the user's timetable URL and whether they want to receive emails.
- Send an email at 15:30 HKT every weekday and at 10:00 HKT every weekend.
- Homework is displayed in an easy-to-read format so as not to stress the user.

Watch a video detailing all the features [here](#) — [README](#).

Technical Details

- AI (Gemini) was used for:
 - All RegEx-related code
 - The retry code in timetable.js to prevent bugs
 - The async promise and pLimit code in email.js after timeouts occurred
 - Some colour palette choices and font choices
 - CSS for toggle switch
 - AI code was always reviewed and modified based on the specific need. The AI never knew the full context and only made fixes to small things; hence the modifications made.
 - README
- The files email.js and api.js use Netlify Blobs to store user data in the cloud.
 - The file api.js uses Netlify Functions to access the user data and modify it from the website.
 - The files weekdays.js and weekends.js use Netlify Scheduled Functions to email all the users once every day.
 - The file email.js uses the Brevo API to batch-send each user a custom email.
 - The file timetable.js uses node-ical to parse the timetables found.
 - The file email.js uses pLimit to throttle the network requests to speed up the code.
- Watch a video detailing all backend tools [here](#) — [README](#).
